Choosing the right Web Site Hosting company to represent your business has become increasingly difficult. There are numerous vendors suitable for Small Business Web Site Hosting, but which one is right for you?

Minimum uptime guarantees of 99.9% seem fantastic but considering that this actually means, it could be down for up to 43.2 minutes month, the question is when? Overseas servers actually have there peak during different times to those in Australia. When you purchase a hosting package, you are typically sharing the server with a number of different sites. This is done to help reduce costs and whilst providing high performance servers and large bandwidth pipes. Eventually your site might command a dedicated server to handle the server loads. But who is going to monitor your server 24 hours a day? Usually in a shared arrangement the other web site owners may report that there is a problem with the server and have it resolved before you even realized. Ability to host Multiple Domains and multiple sub domains are a must for the webpreneur as it allows for easy expansion without having to pay for a new hosting account each time. This could take the form of a sandbox, where new sites are developed and launched, then finally moved to a separate account once the demand commands it.
